

ASBESTOS CONSULTING SERVICES

CLIENT: Large manufacturing and research facility

LOCATION: Far North Chicago Area, Illinois

Highlights: Facility Inspection, Materials Sampling, Analysis, Management Planning, Project Design, Project Management, Air Sampling

Environmental Services, Inc. (ESI) has been the primary provider of asbestos consulting services for this client for over fifteen years. The multi-campus complex facility, including campuses in Wisconsin and California, has been proactive about maintaining and renovating all of the buildings on its many acres. Originally, Environmental Services, Inc. (ESI) inspected every facility on the campus for suspect asbestos-containing materials (ACM). Samples were collected and analyzed. A management plan was developed, including AutoCAD drawings delineating sample locations and homogeneous ACM areas. And over time, ESI has provided the same service and management plan to the campuses in Wisconsin and California.

This document has been a critical tool in planning renovation projects. ESI works with the client to plan the projects: timing, project design, concerns about sensitive laboratory and production environments, and accommodating critical operating functions. In addition, our project managers provide consistent coordination with the client management team and the general contractor and other trades to assure safety and on-time completion.

With the completion of each project or project phase, the facility AutoCAD drawings are revised to accurately reflect the current status of ACM areas.
