

IAQ CASE STUDY

Hurricane Andrew

A national bank, whose Chicago location is a long-time client, contacted ESI post Hurricane Andrew to go to its facility in Florida to assess the indoor air quality for mold and bacteria in order to assure the health of all workers and customers.

ESI provided a complete facility indoor air quality assessment, with a detailed report identifying areas assessed and analyzed. In addition, our licensed engineer/project manager served as a vital liaison to our client's insurance company to assure that our client was compliant and that there was complete understanding with the insurance company of the issues.
